These proceedings collect selected papers from the 8th International Conference on Green Intelligent Transportation Systems and

Safety held in Changchun on July 1-2, 2017. The selected works, which include state-of-the-art studies, are intended to promote the development of green mobility and intelligent transportation technology to achieve interconnectivity, resource sharing, flexibility and higher efficiency. They offer valuable insights for researchers and engineers in the fields of Transportation Technology and Traffic Engineering, Automotive and Mechanical Engineering, Industrial and Systems Engineering, and Electrical Engineering. Apart from the procedural information that describes how a device should be operated, instructions for

use include different types of declarative information, such as information about the internal working of the device (system information) and information about the circumstances in which the different functions can be used (utilization information). In this study, the use and the effects of system and utilization information are investigated in a number of experiments. The results demonstrate that users spend a considerable amount of time on reading each information type. However, contrary to common belief, system information has only limited effects; utilization information does not affect task performance at all. Moreover,

users of instructions without declarative information are more confident in their ability to learn to work with the device and consider the learning process less difficult than users of instructions with declarative information. These results suggest that users of instructions without system and utilization information are capable to use other information sources such as the procedural information and the interface of the device to derive the required declarative knowledge. This book covers the basic concepts and principles of operating systems, showing how to apply them to the design and implementation of complete operating systems

for embedded and real-time systems. It includes all the foundational and background information on ARM architecture, ARM instructions and programming, toolchain for developing programs, virtual machines for software implementation and testing, program execution image, function call conventions, run-time stack usage and link C programs with assembly code. It describes the design and implementation of a complete OS for embedded systems in incremental steps, explaining the design principles and implementation techniques. For Symmetric Multiprocessing (SMP) embedded systems, the author examines the ARM

MPcore processors, which include the SCU and GIC for interrupts routing and interprocessor communication and synchronization by Software Generated Interrupts (SGIs). Throughout the book, complete working sample systems demonstrate the design principles and implementation techniques. The content is suitable for advanced-level and graduate students working in software engineering, programming, and systems theory.
